

Progress Checkpoint — User Requirements & Prioritization

Context: You have started building. This checkpoint validates your assumptions against real users and forces you to re-prioritize before the final sprint.

Project Name: AI Line Chatbot for Agricultural Drone Knowledge Base

Part 1 — User Requirements

- Interview at least one user who is your actual target users (not classmates role-playing).
- Document for each: role, how many, and how contacted (in person / call / chat).
- Report 3-5 key findings in the users' own words (quote or close paraphrase).
- Include evidence: a photo, screenshot, or chat capture of each session.

Interviewer Info

Information	Details
Role	Drone pilot
Amount	1
Contacted	Line and Google Meet

Key findings (What is the feedback of interviewer about the problem and the important features)

1. The interviewer prefers an AI Chatbot that can provide recommendations and answers that feel like having a book or an expert available all the time.
2. Easy steps by steps for drone registration and flight authorization (CAAT, NACD).
3. Answers should include clear references from reliable and preferably Thai sources.
4. Separate factual questions that can be handled through simple logic from opinion based questions that require AI.
5. The system should expand beyond drone operation to agricultural tasks (e.g. chemical and product information, drone pilot license examination information)

Part 2 — MoSCoW Prioritization

Priority	Feature No.	Features	Traces to which finding
Must have	1	AI answers within the scope	Key finding 1 & 4
	2	Heading for quick drone registration and authorization	Key finding 2
	3	AI answers include official website or information references	Key finding 1 & 3
Should have	4	Chemical and product information	Key finding 3 & 5
	5	Drone pilot license and examination information	Key finding 3 & 5
Could have	6	Autofill system for drone registration and authorization form	Key finding 2
Won't have (this time)	7	Weather forecasting	Key finding 1 & 5

Table 1 MoSCoW Prioritization

- Each Must have must trace back to a specific interview finding. A feature with no user evidence is not a Must.
- Won't have (this time) must be filled — this shows you can control scope.

Part 3 — Revised Timeline

- Show original plan (from proposal) → current status → remaining weeks, by week (W1, W2...).
- Remaining weeks must be mapped to your Must / Should items.

Activity / Week	W1	W2	W3	W4	W5	W6	W7	W8
Define and study the topic; analyze the problem.	✓							
Create the database and schema.		✓						
Develop Backend / Webhooks			✓	✓				
Develop the RAG system.					✓			
Develop a logic system to prevent errors.						✓		
Test,improve the system and report.							✓	✓

Picture 2 Original plan

 : Current  : In progress (x): Feature number

Activity	W1	W2	W3	W4	W5	W6	W7	W8
Define and study the topic, analyze the problem.								
Design the database and schema.								
(2)Develop Frontend including quick drone registration and flight authorization header (Must have)								
Develop Backend and Webhooks then test the connection								
(1,3)Develop RAG system and implement cited AI Q&A (Must have)								
Implement Rule-based FAQ / logic								

Drone registration and Flight authorization workflow								
(4,5)Chemical, drone pilot license and examination information (Should have)								
User testing, bug fixing and refinement								
Final documentation and report								

Table 2 Revised timeline
